ACCESS ISSUES UNDER EU REGULATION AND ANTI-TRUST LAW
- THE CASE OF TELECOMMUNICATIONS AND INTERNET MARKETS

Conference, June 23-24, 2000, Washington D.C.

Panel on Substantive Comparative Antitrust Issues in Japan, the US and the European Union

COMPETITION POLICY IN THE GLOBAL TRADING SYSTEM :
*PERSPECTIVES FROM JAPAN, THE UNITED STATES AND THE EUROPEAN
UNION*

***The University of Oklahoma College of Law and The Center for Global
Partnership - The Japan Foundation***

EXECUTIVE SUMMARY

Access has become a key issue for regulation and antitrust in the Internet age. Quite contrary to much of the beliefs of Internet libertarians who count on low costs of entry and a robust competitive environment, many segments of the new Internet-based economy could develop, driven by the requirement in many instances to show world-wide presence to reach scale economies, towards structures controlled by highly dominant enterprises. This paper reviews three issues which in the view of the author are fundamental to driving theory and practice with regard to access to telecommunications and the Internet in the European Union : it reviews the current EU framework of access and interconnection to the basic layer of Internet access, the telecommunications network ; it takes then a closer look at the recent changes of the system, even if the current reform process is still not concluded ; and it discusses as a third issue access and control of the Internet and the concept of "top-level Internet connectivity" which has lately become central in this context.

I) INTRODUCTION

Access has become a central issue for regulation and antitrust in the Internet age¹. Firstly, the new communications infrastructure is, by definition, a layered system², on top of which e-based transactions —

¹ The author is currently Visiting Fellow at the Weatherhead Center for International Affairs, Harvard University, and Adviser to the Directorate General for Competition, European Commission. The statements put forward in this paper are solely the author's responsibility and do not represent positions by the European Commission. He can be reached at ungerer@cfia.harvard.edu.

The paper is written from a European perspective, with occasional references to US and Japanese situations. Thanks are due to the Weatherhead Center's Fellows Programme for support, and to Anthony G.Oettinger and John C.B. LeGates, Program on Information Resources Policy, Harvard University, for review and discussion. Special thanks are also due to Donald Halstead for editing remarks on this version.

² The Internet has been defined as follows : " The 'Internet' refers to the global information system that (i) is logically linked together by a globally unique address space based on the Internet Protocol (IP) or its subsequent extensions / follow-ons ; (ii) is able to support communications using the Transmission Control Protocol / Internet Protocol (TCP/IP) suite or its subsequent extensions / follow-ons and /or other IP compatible protocols ; and (iii) provides uses or makes accessible , either publicly or privately, high level services layered on the

commonly called e-commerce — take place. Essential layers of this new infrastructure are either still under bottleneck control or threaten to fall under such control, local telecommunications access being an example of the first, access to "top-level Internet connectivity" of the second. Both are discussed in this paper.

The shift of the economic base to a networked-based economy on a broad scale — the essential characteristic of what has come to be called the New Economy — is for the first time making markets global in real terms. In essence this means that economic activities — and potential anti-competitive behaviour — not only become more difficult to regulate and check in the different geographical markets and jurisdictions, but that the behaviour itself and its possible anti-competitive effects can only be judged by appreciating it on a global level. This means a new challenge for cooperation between regulators and antitrust authorities at a global level. At a more profound level, it also implies the requirement for re-appreciating the adequacy of institutional arrangements for dealing with these issues.

There have been suggestions that the New Economy implies a fundamental change in the operation of competitive markets and the principles that describe the behaviour of economic agents in such markets and which are at the very basis of antitrust.. "The way companies buy and sell is changing. The way they collaborate is changing. And these are scale businesses ; they do tend to be 'winner takes most'. Information, transactions, tend to accrue to the No 1 player in the market, whether it is because they set the standards or they have critical mass."³ Or in even stronger terms : "the constant pursuit of that

(cont'd)

communications and related infrastructure described herein." See Barry M. Leiner, Vinton G. Cerf, David D. Clark, Robert E. Kahn, Leonard Kleinrock, Daniel C. Lynch, Jon Postel, Larry G. Roberts, Stephen Wolff, "All About the Internet : A Brief History of the Internet", at 16, Federal Networking Council, Resolution 10/24/1995, Internet Society (ISOC), available at <<http://www.isoc.org/internet-history/brief.html>>.

This technical definition requires explanation in economic and market terms. See *infra*, in particular chapter IV.

³ Ken Fox, Internet Capital Group, quoted by Alan Murray in "For Policy Makers, Microsoft Suggests Need to Recast Models", *Wall Street Journal*, 9 June 2000. Available at <<http://interactive.wsj.com>> .

monopoly power becomes the driving thrust of the New Economy. And the creative destruction that results from all that striving becomes the essential spur of economic growth."⁴

By the end of 1999, some 260 million users were connected worldwide to the Internet, out of which there were 111 million in the United States, 65 million in Europe, and 18 million in Japan⁵. This means that at this stage nearly three-quarters of Internet use is accounted for by the triad US, Japan, and European Union.

In a world increasingly determined by network effects and the related externalities⁶ it is not astonishing that major recent antitrust cases have been dominated by this issue. In the major antitrust case currently dealt with in the U.S., the issue of Internet access software has been critical. In the EU, the debate on local access to the telephone networks has become a major element in the European Commission's overall drive for developing the Internet economy.⁷ In EU antitrust, the issue of access to "top-level Internet

(cont'd)

⁵ Cyber Atlas : "Internet Statistics and Market Research for Web Marketers", available at <<http://cyberatlas.internet.com>> .

⁶ [Positive] externalities are the benefits that accrue to parties other than the parties that produce them. See Paul R. Krugman, Maurice Obstfeld, *International Economics, Theory And Policy* (Reading, Massachusetts : Addison-Wesley-Longman Inc., Fifth Ed. 2000), 280 : Technologies and Externalities.

A network externality "is the benefit gained by incumbent users of a group when an additional user joins the group. The group can be thought of as a 'network' of users, hence the term network externality. When the economic benefit of an additional user is positive, it is a positive network externality", Lee W. McKnight, Joseph P. Bailey (eds), *Internet Economics* (Massachusetts Institute of Technology, fifth printing 1999), 6. As a consequence, industries with network externalities are characterised by positive critical mass, i.e. users prefer large networks in order to reap the benefits offered by network externalities, and networks of small sizes cannot attract a sufficient number of users. The Internet exhibits strong positive externalities. See J. Gong and P. Srinagesh, "The Economics of Layered Networks", in Lee W. McKnight, 66, *supra*. and the discussion in Chapter IV.

⁷ "Europe — an Information Society For All", Communication on a Commission Initiative for the Special European Council of Lisbon, 23 and 24 March 2000, available at <<http://www.europa.eu.int>>.

connectivity"⁸ has been the subject of two major cases over the last two years. In Japan, the issue of local access and interconnection to the NTT network and the conditions attached to it has been a continuing theme in the domestic market, and in its trade relations.

It is against this background that this paper will review three issues which in the view of the author are fundamental to driving theory and practice with regard to access to telecommunications and the Internet, at least in the European Union⁹ :

- the paper will discuss as a first case the current framework of access and interconnection to the basic layer of Internet access, the telecommunications network. This will give opportunity to discuss in particular the current relationship of sector-specific telecommunications regulation, as it has been built in the EU since full liberalisation of the sector on 1 January 1998¹⁰, and EU

⁸ See *infra*, Chapter IV.

⁹ Given the close relationship of the approach taken under the EU's regulatory framework on telecommunications access with the so-called Regulatory Annex (also known as the "Reference Paper") developed in the context of the World Trade Organisation (WTO) negotiations on the WTO Basic Telecommunications Agreement (subsequently integrated by the EU, as well as the US, Japan and other countries, into their commitments under that agreement), many of the issues discussed in this paper will emerge in all three jurisdictions, though in different forms, given the different set-up of sector regulation and antitrust law in these jurisdictions.
See *Legal Texts and Commitments, GATS* [General Agreement on Trade in Services], *Commitments by Sector, Communications Services — Telecommunications Services* and "Additional Commitment by the European Communities And Their Member States", available at <<http://gats-info.eu.int/gats-info/g2000.pl>>.

¹⁰ The EU framework for telecommunications consists, roughly speaking, of the so-called sector-specific ONP ("Open Network Provision") framework operated by the European Commission and the "National Regulatory Authorities" (NRAs) of the 15 Member States of the EU, and EU competition law applied by the European Commission and the national competition authorities and the national court system.

Corresponding authorities in the US are the Federal Communications Commission and the US antitrust system. In Japan they are the Ministry for Posts and Telecommunications (MPT) and the Japanese Fair Trade Commission. For a recent comparative analysis of telecom regimes in the United States, Japan, the EU, Canada, Australia, New Zealand, and other telecommunications markets see Dianne Northfield, *The Information Policy Maze: Global Challenges — National Responses* (Melbourne : RMIT University Press, 1999).

The EU telecommunications sector was liberalised by a series of measures (liberalisation directives issued under EU competition law, Art. 86 of the Treaty Establishing the European Community [former Art. 90, as renumbered by the Amsterdam Treaty]) and harmonisation Directives issued by the European Parliament and the Council on the basis of Art. 95 TEC (former Art. 100a).

The measures culminated in the adoption by the European Commission of the Full Competition Directive,

antitrust law.

- in the second part, a closer look will then be taken at the recent changes to this system, even though the current reform process is still not concluded.¹¹ A major aspect of the current reform is the recognition that the new environment outdates a number of traditional sector regulatory concepts and requires more reliance on, and integration of, competition law approaches¹², in particular those concerning concepts of dynamic market definitions, in order to deal effectively

(cont'd)

Commission Directive 96/19/EEC, full competition in telecommunications markets, OJ L 74/13 (1996) mandating full liberalisation of telecommunications in the EU on 1 January 1998. Five Member States were allowed various transition periods under special Decisions by the Commission under Art.86, the last deadline (Greece) ending on 31 December 2001.

The EU Full Competition Directive was of similar importance for the European market as the enactment by Congress of the Telecommunications Act of 1996.

For a recent comparison of telecom deregulation in Europe and the United States, see Viktor Mayer-Schoenberger and Matthias Strasser, "A Closer Look At Telecom Deregulation : The European Advantage", *Harvard Journal of Law & Technology* (forthcoming).

- ¹¹ The Commission has carried out a series of reviews of the sector, essentially aiming at taking account of changes required by convergence of markets and the Internet. The recent review process started with "Green Paper on the convergence of the telecommunications, media and information technology sectors and the implications for regulation", COM(1997)623, and a series of subsequent communications by the Commission. It culminated with the Commission's issue of "Towards a New Framework for Electronic Communications Infrastructure and Associated Services : The 1999 Communications Review", COM (1999)539, and "The Results of the Public Consultation on the 1999 Communications Review and Orientations for the new Regulatory Framework", Communication from the Commission, COM(2000)239 on 26 April 2000.

Available at <http://www.europa.eu.int/comm/information_society/policy/telecom/index_en.htm>.

On the basis of the orientations, the Commission adopted on 12 July 2000 a package of legislative proposals. See "Commission proposes overhaul of rules for electronic communication", European Commission press release IP//00/749, 12 July 2000. Available at <<http://europa.eu.int>>.

For a general discussion of convergence, see also P.H. Longstaff, "New Ways to Think About the Visions Called 'Convergence': a Guide for Business and Public Policy" (Unpublished Draft Report), Program on Information Resources Policy, Center for Information Policy Research, Harvard University. Available at <<http://www.pirp.harvard.edu>>.

- ¹² Similar issues are arising in other jurisdictions. Compare William H. Read, Ronald A. Weiner, "FCC Reform : Does Governing Require a New Standard", Program on Information Resources Policy, Center for Information Policy Research, Harvard University (1999), where the authors suggest that the FCC should "adopt a public interest standard that incorporates procompetitive antitrust principles". Available at <<http://www.pirp.harvard.edu>>.

with access issues in the future.

- the third issue discussed in this paper concerns the development of the concept of "Internet connectivity" and access to it, as it has emerged in Europe, notably on the basis of the investigation and decision in 1998 on *Worldcom/MCI*¹³. This investigation became a key step in the competitive analysis of Internet access and Internet control. The case developed for the first time in Europe a coherent system of market definitions taking full account of the network effects fundamental in the Internet age, notably, the concept of a global market for "top-level Internet connectivity".

Within the framework of its overall political goals, as expressed at the Lisbon European Council in March 2000, access to the new communications structures in the Internet age is of fundamental importance for the European Union. It is also a major measure that the European consumer applies in his appreciation of the success of European policies, and in particular EU antitrust policies. As European Competition Commissioner Monti declared on the occasion of the opening of the Competition Day 2000 "opening up the telecommunications sector to competition has cut telephone charges in some cases by up to 35%, increased the range of services provided and created new jobs". This statement emphasizes the basic message that "European citizens have everything to gain from competition policy".¹⁴

II) THE DUALITY OF SECTOR REGULATION AND ANTITRUST LAW : THE CURRENT EU APPROACH FOR ACCESS TO TELECOMMUNICATIONS NETWORKS

Since the inception of EU telecommunications liberalisation in 1987,¹⁵ a comprehensive framework of sector-specific regulation has developed, both at EU level as well as at the EU Member State level (the EU ONP framework).¹⁶ In parallel, it is the sector where the European Commission has to date developed the most consistent position concerning the application of EU Competition Law to bottleneck access, with the adoption of the "Access Notice" ¹⁷.

¹⁵ With the publication by the European Commission of "Towards a Dynamic European Economy : Green Paper on the Development of a Common Market for Telecommunications Services and Equipment", COM(87)290.

¹⁶ The history and development of telecom markets and regulation in the European Union are extensively covered elsewhere. See for example Herbert Ungerer, "EC Competition Law in the Telecommunications, Media , and Information Technology Sectors", *International Antitrust Law & Policy*, Fordham University School of Law, 1995 Fordham Corp. L. Inst. 000(B. Hawk ed.1996).

EC telecommunications liberalisation developed mainly as a consequence of three factors. First, by the end of the eighties, the growing digitisation of European telecommunications networks began to transform them into multipurpose information infrastructures. The opportunities offered by telecommunications networks and services started to extend into markets substantially beyond the traditional telephone service, particularly the so-called value-added-services — the precursors of today's Internet services and ISPs (Internet Service Providers). As a result, access to the traditional monopoly networks in the telecommunications sectors became a major issue in all EU Member States, and there was a growing conviction that without a loosening of monopoly rights — *and* a consequential definition of access conditions — it could neither be assured that new markets could develop, nor that the new services offered could be made available to consumers. Secondly, in *British Telecommunications (Case C-41/83 (1985) ECR 873, (1985)2 CMLR 382)*, the European Court of Justice confirmed that EU Competition Rules applied to the telecommunications sector. Thirdly, the impact of developments in the United States, in particular the AT&T divestiture consent decree and the resulting transformation of the US market, began to be felt in Europe. At the same time the progressive deregulation of the telecommunications sector and the privatisation of British Telecom in the United Kingdom since 1982 made Europe more receptive to the concept of market deregulation.

The combination of these factors led the Commission to issue, in 1987, its Telecommunications Green Paper (supra), which set forth a comprehensive policy framework for EU action in the telecommunications sector. The Green Paper envisaged a number of changes in EU telecommunications leading towards progressive liberalisation. Most notably in the context of this debate, already at the time of the Green Paper, definition of harmonised access conditions (the "Open Network Provision" or "ONP" concept) became central.

By 1993, an EU Telecom Review led to an agreement on the full liberalisation of the EU telecommunications market by 1 January 1998, including the remaining public voice telephony and telecommunications network infrastructure/facilities monopolies.

The 1993 Review led, inter alia, to an agreement by the EC Council to adjust the ONP framework to fully liberalised market conditions and to establish a regulatory framework for interconnection and access to services and networks.

¹⁷ Notice on the application of the competition rules to access agreements in the telecommunications sector (OJ C

With the development of this framework, both sector regulation and antitrust became, in a complementary manner, the two pillars on which the regulatory framing of the development of the sector was based¹⁸.

In the course of implementing the telecommunications policy concept, the application of EU competition law was of primary importance from the very beginning¹⁹. Access and its relationship to Competition Law figured centrally on the sector agenda as early as *British Telecommunications*, often called a legal cornerstone of the EU telecommunications framework. Already in *British Telecommunications* the European Court of Justice hinted at a number of main issues in access which were only fully worked out subsequently : the Court confirmed the requirement to give access to a "value-added" service provider,²⁰

(cont'd)

265, 22.8.1998, p. 2), hereafter referred as the *Access Notice*. Available at <<http://www.europa.eu.int/eur-lex/en/index.html>>.

The introduction to the EU's access and interconnection framework in this chapter is partly based on an article written by the author in connection with "Third Competition Law Annual 1998 : Regulating Communications Markets" (eds. Claus Dieter Ehlermann, Louisa Gosling : Hart Publishing, Oxford, forthcoming in July 2000).

- ¹⁸ This situation is not dissimilar to the basic regulatory approach in the two other jurisdictions, particularly the United States, though emphasis has been different due to the different jurisdictional context. In the US, major starting points of liberalisation and competition were the FCC's Computer I and II inquiries, with a long preceding history of gradual liberalisation since the first FCC decision on attachment of terminal equipment other than AT&T's in 1956 (telephone accessory devices). On the antitrust side, the AT&T divestiture decision (consent decree) determined the competitive structure of the US telecommunications market up to the Telecommunications Act of 1996 which established the basic principles for a fully competitive US telecommunications market (as did the Full Competition Directive for the EU market).

For a recent comparative analysis, see Viktor Mayer-Schoenberger et al, "A Closer Look At Telecom Deregulation : the European Advantage", supra. See in particular their analysis of different approaches in the two jurisdictions to the relationship between the federal and state level in the US, the EU level and the 15 Member States in Europe, which turned out to be quite decisive in determining the speed of the transformation (and the legal hurdles which were encountered).

- ¹⁹ In December 1989, a basic policy compromise defined the respective role of measures based on EU competition law (Art 86, associated with application of Art 81 and 82, as well as other EU Treaty Articles), and harmonisation through internal market legislation based on Article 95 of the EC Treaty. The compromise reached between the Commission and the Member States on the occasion of the adoption of the *Telecommunications Services Directive* and the *ONP Framework Directive* established the principle of a complementary role of liberalisation under Article 86, EU Competition Law, and harmonisation under Article 95.

The *Full Competition Directive* was based on Article 86 and the associated Competition Law principles. The *ONP Interconnection Directive* is based on Article 95, internal market legislation.

- ²⁰ Case C-41/83 (1985), supra. The case concerned the activities of certain private messaging forwarding agencies via the BT network at the time (1982). In its decision, the Commission found that British Telecom (at that time still in

and it also specifically addressed the issue that development of new technologies in this context was in the public interest.

It should therefore be noted that as early back as *British Telecommunications* three elements emerged which are also prevalent in the current debate on access :

- the key role of access to the network of the incumbent ;
- the issue of non-discriminatory access ; and
- the issue of the development of new technology markets / new services.

As value added services were progressively liberalised in Europe, access to bottleneck network facilities started to become both a recurrent theme and a central issue in the telecommunications, media, and information technology markets.

The issue of access and interconnection acquired a key role in the big alliance cases that, in the mid-nineties, began to dominate attention in the application of EU competition law (and more generally at the global level in antitrust) as a prelude to full liberalisation of telecoms in the EU with the *Full*

(cont'd)

a monopoly position and in public ownership) had abused its dominant position in the telecommunications systems market by taking measures to prevent certain private messaging agencies from offering a given type of service. The service permitted telex messages to be received and forwarded on behalf of third parties at prices lower than those charged by BT for its international telex service.

It should be mentioned that one of the main issues in that case was how far Article 86(2) of the EU Treaty could be applied to exempt BT's abuse of its dominant position on the telecommunications system market by preventing access and the forwarding of the messages in question.

First, the Court made clear that it was for the Commission to decide (subject to review by the Court) on any derogation to be granted from the application of the competition rules on the basis of Article 86(2) (former Art 90(2)). Art 86 (2) stipulates that "undertakings entrusted with the operation of services of general economic interest...shall be subject to the rules contained in this Treaty, in particular to the rules on competition, in so far as the application of such rules does not obstruct the performance, in law or in fact, of the particular tasks assigned to them. The development of trade must not be affected to such an extent as would be contrary to the interests of the Community (emphasis added).

Second, the Court made it clear that it would favour a narrow interpretation of the scope of a derogation under Article 86(2) from obligations under competition law, in particular taking into account possible resulting delays in the

Competition Directive of 1996 , in the United States with the adoption of the 1996 Telecom Act²¹, and at the global level with the WTO agreement on basic telecom services of 1997.

Three aspects should be emphasised :

- *Firstly*, with EU full liberalisation and the emerging sector-specific EU framework, the definition of access and interconnection within the ONP framework acquired more and more importance. This was particularly refined with the adoption of the ONP Interconnection Directive 1997.
- *Secondly*, under the sector-specific framework, independent National Regulatory Authorities (NRAs) were established in all Member States, acting as a decentralised regulatory implementation structure but within an EU-harmonised framework.²²
- *Thirdly*, originally due to developments in other sectors, access to bottleneck facilities began to

(cont'd)

development of new technologies.

²¹ See supra.

²² This framework was defined, inter alia, in the ONP Interconnection Directive to substantial detail. European Parliament and Council Directive 97/33/EC, OJ L 199, p. 32, 26.7.1997. Available at <<http://www.europa.eu.int/eur-lex/en/search.html>>.

As regards the application of EU competition rules, EU competition law can be enforced both by the European Commission (under the control by the European Court of Justice) and the antitrust authorities (and courts) at Member State level, subject to the procedures established by the basic procedural Regulation 17 (Council Regulation No17, implementing Articles 81 and 82 of the Treaty, OJ 13, 21.2.1962, p.204., and subsequent Notices). The current reform process of Regulation 17, which implies a fundamental reform of the procedural provisions of EU competition law, emphasises further decentralisation of enforcement to national antitrust authorities, as far as procedures following Regulation 17 are concerned (i.e. excluding procedures falling under the EU Merger Regulation (Regulation (EEC) No 4064/89 as amended), and state aids). The aim is to increase efficiency of enforcement through decentralisation from EU level to Member State level.

See "White Paper on modernisation of the rules implementing application of Articles 85 [now 81] and 86 [now 82] of the EC Treaty", Commission programme No 99/027, 28.4.1999. Available at <http://www.europa.eu.int/comm/dg04/entente/en/wb_modernisation.pdf>.

be defined more explicitly as an *essential facilities concept* in the context of EU competition law, in particular under Article 82. This concept found its current, most explicit formulation in the *Access Notice*, which drew its conclusions from a broad range of Commission decisions on access to bottlenecks under Competition Rules, and from Court Rulings in this context.

It is worthwhile taking a quick look at the relationship of the working of sector-specific regulations under the ONP framework and general Competition Law. This relationship is defined in substantial detail in the *Access Notice*.

The *Notice* states that a party concerned with access to a telecommunications network or another critical bottleneck network resource in the European Union faces essentially two main choices :

- specific national regulatory procedures now established in accordance with Community Law and harmonised under Open Network Provision ; and
- an action under national and/or Community Law, in particular Competition Rules, before the Commission, a national court, or a national competition authority.

In the *Notice*, the Commission recognises that Community Competition rules are not sufficient to remedy all the various problems in the telecommunications sector. The (sector-specific) *NRAs* therefore have a significantly wider ambit and far-reaching role in the regulation of the sector.

The ONP Directives impose on TOs (Telecommunications Operators) having Significant Market Power²³ certain obligations of transparency and non-discrimination that go beyond those that would

(cont'd)

²³ The concept of Significant Market Power (SMP), central in ONP, is discussed later.

normally apply under Article 82 of the Treaty. ONP Directives lay down obligations relating to transparency, obligations to supply, and pricing practices . These obligations are enforced by the *NRAs*, which also have jurisdiction in ensuring effective competition.²⁴

However, the *Notice* states that "if interim injunctive relief were not available, or if such relief was not likely adequately to protect the complainant's right under Community Law, the Commission could consider that the national proceedings did not remove the risk of harm, and could therefore commence its examination of the case under EU competition rules".

The Commission may also intervene if, for example, the issue is of sufficient pan-European interest to justify immediate action. More generally, if it appears necessary, the Commission can also open own-initiative investigations or launch sector inquiries where it considers this necessary.²⁵

Summarising, in the European framework a *dual* system has developed concerning treatment of access to bottleneck situations. Within the framework of sector-specific regulation of access — the ONP framework and the specific regulations at the national levels — the *NRAs* can act in a substantial *ex-ante* manner and mandate in substantial detail interconnection provisions concerning pricing, accounting, and the technical details of access.

²⁴ This is, however, subject to important caveats :
Firstly, under Community Law, national authorities, including regulatory authorities and competition authorities have a duty not to approve any practice or agreement contrary to Community Competition Law.
Secondly, an efficient procedure must be in place. According to the *Access Notice* an access dispute before a National Regulatory Authority should be resolved within six months of the matter first being drawn to the attention of that authority. This resolution should take the form of either a final determination of the action or another form of relief which would safeguard the rights of the complainant.
Thirdly, there must be availability of and criteria for interim injunctive relief.

²⁵ Under *Regulation 17*, the Commission could be seized of an issue relating to access agreements by way of a notification of an access agreement by one or more of the parties involved, by way of a complaint against a restrictive access agreement or against the behaviour of a dominant company in granting or refusing access, by way of a Commission own-initiative procedure into such a grant or refusal, or by way of a sector inquiry. In addition, a complainant may request that the Commission take interim measures in circumstances where there is an urgent risk of serious and irreparable harm to the complainant or to the public interest.

In the current interpretation of EU Competition Law, application of Competition Rules to access issues is essentially limited to dealing *ex-post* with the abuse of a dominant position and the measures taken to terminate such abuse. According to the *Access Notice*, sector-specific regulation will generally take precedence with regard to action under Competition Law, if such sector-specific action is pro-competitive and efficient.

In practice, this means that the current EU framework for obtaining access to telecommunications facilities and services rests on two competing concepts for remedying anti-competitive effects resulting from the existence of bottleneck structures :

- enforcement of access and interconnection provision under sector-specific regulation, essentially by the NRAs at the State level, within an EU harmonisation framework ;
- enforcement of access, as far as a plaintiff party can claim access under EU competition law, essentially under the European version of the essential facilities doctrine, as it is currently evolving.

Under sector-specific regulation (the "ONP" framework), a general obligation to supply access is imposed on public network operators with Significant Market Power (the "SMP" operators), principally defined as operators with more than a 25% market share.²⁶ This makes the SMP concept central to the

²⁶ According to the *ONP Interconnection Directive* the notification (by the NRA) of an organisation as having significant market power depends on a number of factors, but the starting presumption is that an organisation with a market share of more than 25% will normally be considered to have significant market power. Other factors which can be taken into account by the NRA are turnover relative to the size of the market, ability to influence market conditions, control of the means of access to end-user, international links, access to financial resources and experience in providing products and services in the market, as well as the situation of the relevant market.

In practice, to date the traditional telephone incumbents have been notified as having SMP. Some Member States have notified certain public mobile operators as having SMP, or are considering this.

framework²⁷.

However, it is interesting to note that the full and speedy enforcement of fair interconnection and access under this regime was mainly achieved by combination with Recommendations ("soft legislation"²⁸).

A Recommendation on Interconnection Pricing established price ranges for interconnection rates across the EU, based on the "best practice" of the three Member States with the lowest interconnect rates at the time of the issuing of the Recommendation.

These ranges have largely determined the incumbents' interconnection offerings submitted and approved by the national regulators in the Member States. This benchmarking of interconnection pricing against "best practice" ("regulatory competition") has made the EU an area with some of the lowest interconnection rates in the world market, with local access in the range of 0.5-1 Eurocents / minute²⁹.

Therefore, it seems that *sector-specific regulation based on the ONP framework* has been highly effective in achieving rapidly low priced access to the incumbents' local telephone networks across the EU.

In major cases where procedures had been opened under Competition Rules, the Commission therefore has tended to stay procedures where sector-specific proceedings under ONP or derived national

²⁷ Essential articles of the Interconnection Directive in this context are : Article 4.2 : obligation to supply access ; Article 6 : non-discrimination ; Article 7 : cost orientation ; Article 8 : accounting separation for "interconnection services". Available at <<http://www.europa.eu.int/eur-lex/en/search.html>>.

²⁸ Soft legislation are measures non-binding on Member States under the EU Treaty : in general Recommendations and Resolutions. See *Commission Recommendation 98/195/EC on Interconnection in a Liberalised Telecommunications Market : Interconnection Pricing* as amended. OJ L 228, 15.8.1998, p.30. Available at <<http://www.europa.eu.int/eur-lex/en/search.html>>.

²⁹ This combination of (binding) Directives with soft legislation was already pointing to the course taken in the current reform. See Chapter III.

regulations were likely to resolve the issue (see the *Mobile Interconnect*³⁰ proceeding and the *Accounting Rate*³¹ proceeding). This confirms the Commission's basic position that sector-specific regulation should

³⁰ *Mobile Interconnect* proceeding : press release IP/98/707, 27.7.1998. Available at <<http://www.europa.eu.int>>.

In January 1998, the Commission launched an inquiry into interconnection charges between fixed and mobile operators opening fifteen cases, i.e. one for each Member State due to growing concern about persistently high prices for mobile communications particularly for fixed to mobile calls. The objective of the Commission's Inquiry was to check whether : prices charged by the incumbent fixed network operator for terminating mobile calls into its fixed network were excessive or discriminatory ; termination fees charged by mobile operators, which have joint control among themselves over call termination in their networks, were excessive, and ; the revenues retained by the incumbent fixed network operator on fixed to mobile calls were excessive.

In the press release, the Commission concluded that at least fourteen cases warranted in-depth investigation given preliminary indications of possibly excessive or discriminatory prices. The fourteen cases comprised: four cases of mobile-to-fixed termination charges by Deutsche Telekom, Telefónica, KPN Telekom (Netherlands) and Telecom Italia respectively, which would be suspended for six months in favour of action by national regulators ; two cases of termination fees charges by mobile operators in Italy and Germany respectively ; eight cases regarding the retention on fixed-to-mobile calls by public switched telecommunications networks (PSTN) operators Belgacom, Telecom Éireann, BT, P&T Austria, Telefónica, KPN Telekom (Netherlands), Telecom Italia and Deutsche Telekom. The Commission would suspend the case involving BT given an on-going inquiry by the UK Monopolies and Mergers Commission (MMC) on this issue (emphasis added).

The approach of close cooperation with national regulators turned out to be largely successful. In May 1999, the Commission announced that it had decided to conclude the EU-wide investigation. This followed an assessment of the substantial price reductions of more than 80% in some cases, in response to the investigation. The Commission recalled that "in conducting the inquiry, launched in February 1998, the Commission co-operated closely with national competition agencies and national regulatory authorities (NRAs) in the EU Member States." See press release IP/99/298, 4.5.1999, "Commission successfully closes investigation into mobile and fixed telephony prices following significant reductions throughout the EU". Available at <<http://www.europa.eu.int>>.

The Commission stated however on the occasion that it intended "to pursue the scrutiny of competitive conditions within an overall sector enquiry of telecoms on key issues, including current roaming conditions between mobile operators."

The Commission has acted similarly in other cases. For example, in early January 1998, the Commission proceeded under Article 86, EC Competition Rules against DT's high fees concerning the provision of carrier-pre-selection and number portability. Given that a parallel procedure was opened before the national NRA, and that fees were considerably reduced, the Commission terminated its own procedure. See press release IP/98/430, 13.05/1998 "Commission terminates procedure against Deutsche Telekom's fees for preselection and number portability and transfers the case to national authorities".

³¹ *Accounting Rate* proceeding : press release IP/98/763, 13/08/1998. Available at <<http://www.europa.eu.int>>.

The Commission opened procedures in the Autumn of 1997 concerning European operators with a potentially dominant position, regarding the accounting rates (transfer prices) charged to terminate international calls. Following a preliminary assessment, the Commission announced in the press release that it appeared that "the international accounting rates charged within the EU by seven operators may result in excessive margins". The seven operators were : OTE of Greece, Post & Telekom Austria, Postes et Télécommunications Luxembourg, SONERA (formerly Telecom Finland), Telecom Eireann, Telecom Italia, Telecom Portugal.

The Commission concluded that it would further investigate on the prices for international phone calls paid to these operators. On the occasion, the Commission stated that "the issue... may also be tackled under the ONP rules (Open Network Provision). In line with its *Notice on the application of Competition Rules to access agreements in the telecommunications sector* the Commission has informed the national regulatory authorities of the findings of its first phase of investigation. In those cases where the relevant authority will decide to pursue the issues under its own jurisdiction, the Commission will stay its own proceedings, and assess in six months whether it should continue its proceedings" (emphasis added).

By April 1999, the Commission stated that "following the swift action by the national regulators", it could close its investigation in respect of a number of the operators concerned. See press release IP/99/279, 29.4.1999, "Commission sees substantial progress in its investigation into international telephone prices". Available at <<http://www.europa.eu.int>>.

take precedence where efficient procedures that can terminate the abuse exist.³²

As regards mandating access to telecommunications facilities under an essential facilities approach under EU antitrust³³, the Access Notice set out basic principles in substantial detail.

The *Notice* uses the expression "essential facilities" to describe a facility or infrastructure that is essential for reaching customers and/or enabling competitors to carry on their business, and which cannot be replicated by any reasonable means.³⁴

³² This has however not prevented the Commission from intensifying its supervision under antitrust powers of the most critical segments of the sector (supra). It has initiated a sector inquiry into general competitive conditions in local network access ("local loop"), the roaming (mobile communications) services market and the pricing of private lines. These inquiries are still ongoing. See press releases "Commission launches first phase of sectoral inquiry into telecommunications : leased line tariffs" (IP/99/786), 22.10.1999, and "Commission launches second phase of telecommunications sector inquiry under the competition rules : mobile roaming" (IP/00/111), 4.2.2000. Available at <<http://www.europa.eu.int>>.

³³ There have been a number of complaints concerning the refusal of access or the conditions attached to it. A number of these complaints were settled by action of the national regulators. This points to the success of the sector regime set up.

There have also been commitments by the parties in a number of merger cases to provide access, in order to make these mergers compatible with competition rules. See Chapter IV.

³⁴ The essential facilities doctrine is a relatively recent concept under EC competition law. It derives from a line of cases, originally in sectors other than telecommunications. See in particular : Joined Cases 6/73 and 7/73 *Commercial Solvents v. Commission* [1974] ECR 223 (chemicals); Commission Decision 94/19/EC of 21.12.1993, *Sea Containers v. Stena Sealink* (OJ L 15, 18.1.1994, p.8) / Commission Decision 94/119/EEC of 21.12.1993, *Port of Rodby* (Denmark) (OJ L 55, 26.2.1994, p.52) (transport); Joined cases C-241 / 91P & C-242/91P, *Radio Telefis Eireann v. Commission*, ("Magill"), [1995] ECR, I-743. See also John Temple Lang, "Defining Legitimate Competition, Companies Duties to Supply Competitors and Access to Essential Facilities", in 1994 Fordham Corp. L. Inst. (Barry Hawk ed., 1993), 245. For a recent survey see inter alia Wolfgang Jauk, "The Application of EC Competition Rules to Telecommunications — Selected Aspects : The Case of Interconnection", *International Journal of Communications Law and Policy*, Issue 4 1999/2000, pp. 57, at <<http://www.ijclp.org>>.

Of particular relevance for the most recent interpretation of the essential facilities concept under EU antitrust law is the Judgment by the European Court of Justice of November 1998, *Oscar Bronner GmbH & Co. KG v. Mediaprint Zeitungs- und Zeitschriftenverlag GmbH & Co. KG*, Case C-7/97, where the Court defined conditions for the application of the principle. Available at <<http://www.europa.eu.int/eur-lex/en/index.html>>.

For a comparative analysis of the essential facilities doctrine under US regulatory and antitrust law, and EC competition law under Article 82, see Venit - Kallaugher, "Essential facilities : a comparative law approach", in Hawk (ed), 1994 Fordham Corp. L. Inst (1995)

It should be noted that the *Additional commitments on regulatory principles by the European Communities and their Member States* ("Regulatory Annex" or "Reference Paper") in the context of the World Trade Organisations (WTO) Basic Telecom Agreement define essential facilities in the following manner :

"Essential facilities mean facilities of a public telecommunications transport network and service that :
 (a) are exclusively or predominantly provided by a single or limited number of suppliers; and
 (b) cannot feasibly be economically or technically substituted in order to provide a service

The Commission "must ensure that the control over facilities enjoyed by incumbent operators is not used to hamper the development of a competitive telecommunications environment. A company which is dominant on a market for services and which commits an abuse contrary to Article 86 [now Article 82] on that market may be required, in order to put an end to the abuse, to supply access to its facility to one or more competitors on that market. In particular, a company may abuse its dominant position if by its actions it prevents the emergence of a new product or service"³⁵.

The *Notice* addresses the balance to be drawn between the rights of those requesting access and those who have to give access, the crucial point in any essential facility concept.³⁶

However, the basic principle to be kept in mind is that the bottleneck holder — given his dominant position — must not act to prevent competition from emerging.

Drawing a balance at this stage, the dual regime in the EU concerning access to telecommunications

³⁵ See *Access Notice*, supra

³⁶ Main principles are (to be taken cumulatively) :

- it will not be sufficient that the position of the company requesting access would be more advantageous if access were granted. Refusal of access must lead to the proposed activities being made "either impossible or seriously and unavoidably uneconomic".
- there is sufficient capacity available to provide access
- the facility owner "fails to satisfy demand on an existing service or product market, blocks the emergence of a potential new service or product, or impedes competition on an existing or potential service or product market."
- the company seeking access is prepared to pay a reasonable and non-discriminatory price and will otherwise in all respects accept non-discriminatory access terms and conditions.
- there is no objective justification for refusing to provide access, "such as an overriding difficulty of providing access to the requesting company, or the need for a facility owner which has undertaken investment aimed at the introduction of a new product or service to have sufficient time and opportunity to use the facility in order to place that new product or service on the market."

The latter expresses the delicate balance which must be found between the interest of the party seeking access (which will generally want to achieve access at low rates and according to its own requirements), and the rights of the bottleneck holder (who will focus on obtaining benefits from the investment undertaken for the development of his own product).

bottlenecks was highly successful as regards its basic purpose : making full EU-wide liberalisation of telecommunications networks and services since 1 January 1998 a rapid success. The rapid establishment of a decentralised but harmonised access and interconnection regime under the Member States' oversight, combined with soft legislation by recommendations and the ultimate threat of intervention under antitrust powers if sector regulation would not resolve issues, led to an effective opening of core segments of the telecommunications network infrastructure, which was just emerging from monopoly control. It allowed rapid development of competition in both long distance and international services, and in the long-distance network backbone, by reassuring market entrants and investors about access and interconnection with the incumbents dominating the networks in the local access market. In the long distance and international markets, prices fell in some cases by a factor of 10 within two years³⁷.

In terms of Internet access, this meant that ISPs (Internet Service Providers) could freely develop. Competition in the long-distance backbone market implied that for the first time there were indications of a significant development of a European-based backbone for Internet traffic.

However, by the end of 1999 it had become clear that major problems persisted :

- firstly, the ONP regime and the derived national sector-specific regimes had become highly dependent on definitions, which implied a high degree of technicality, and therefore a high potential for legal conflict. The regime as established is largely depending in its impact on two concepts : the "category" within which the party seeking access and the bottleneck holder falls; and, in particular, the SMP (Significant Market Power) determination.

³⁷

In a number of Member States, prices fell to US price levels in the long-distance and international call markets within that short period.

In a number of Member States there were threats of major conflicts concerning the interpretation of these concepts. The questions of who qualifies as public network operator (and therefore for the low network-interconnect rates), and who should be designated an SMP operator (and therefore become subject to substantial regulatory scrutiny and to regulatory rate approval) had become central.

- secondly, the issue of competition in the local access market (local loop : the "last mile") remained unresolved, with a persistent market dominance by the incumbents with market shares of 90% and more. In practical terms this meant that access to the Internet in Europe remained substantially more expensive than in the United States.³⁸ In competition terms it meant that the development of alternatives such as cable and wireless access remained uncertain, as long as these means were either under control of the incumbent,³⁹ or the conditions for the full unbundling of the local loop could not be addressed.
- it turned out during the prolonged debate on the consequences of convergence⁴⁰ that the application of the existing framework to the highly complex new markets of convergence and the Internet was uncertain.

With the focussing of the debate in Europe on the creation of a future oriented e-environment as the

³⁸ High per-minute-call charging for the local loop impeded ISPs from offering comprehensive and cheap flat-rate access arrangements as available in the US.

³⁹ On the eve of full liberalisation on 1 January 1998, nearly 60% of cable customers were served by a cable operator wholly or partly owned by the local telecommunications incumbent.

⁴⁰ Green Paper on Convergence, *supra*

main engine of future growth and employment,⁴¹ the debate culminated in Spring 2000 when after a series of consultations, the outline of a new approach seemed to develop.

⁴¹ See Conclusions of the European Council at Lisbon, 23-24 March 2000, at <<http://www.europa.eu.int>>.

III) INTEGRATING SECTOR REGULATION AND ANTITRUST : THE FURTHER DEVELOPMENT OF THE APPROACH

By Spring 2000, it had become clear that the critical issue of Internet access at the basic layer (local telecommunications access) could not be adequately resolved in the EU within the framework developed by then, and that the broader access issues resulting from convergence could not be properly tackled. While the Commission continued to promote the cable⁴² and wireless (fixed and mobile)⁴³ alternatives for access to the Internet as longer term options, it focussed immediate priority on opening full access to the local networks of the incumbents. "Unbundling of the local loop aims to foster competition in local access networks, currently dominated by incumbent operators. New entrants do not have the investment capacity to duplicate the local network. Therefore, they must be allowed to use the incumbents' local loop".⁴⁴ "This will lead to lower local tariffs. And it will speed up the provision of

⁴² Subsequent to a cable review completed in 1998, the Commission adopted in June 1999 an Art 86 Directive under its antitrust powers mandating the legal separation of cable networks from the incumbent telephone companies' networks. This was seen as a minimal condition for developing cable networks towards broadband Internet access. The measure resulted subsequently in partial sale-offs of cable networks by incumbents, or the announcement of plans to do so, by a number of incumbents in EU Member States, in particular by DT and FT, the German and French incumbents. See "Commission Communication concerning the review under competition rules of the joint provision of telecommunications and cable TV networks by a single operator and the abolition of restrictions on the provision of cable TV capacity over telecommunications networks", OJ C 71 (1998), and Commission Directive 1999/64/EC of 23 June 1999, OJ L 175/ 39 (1999). Available at <http://www.europa.eu.int/cgi-bin/eur-lex/search_oj.pl>.

⁴³ The European Commission promoted energetically the development and deployment of broadband mobile communications systems (referred to as "Third Generations Systems" (3G systems), or, in Europe, as "Universal Mobile Telecommunications System" (UMTS)), building on its success in the deployment of the GSM mobile system in Europe. By Spring 2000 a number of UMTS licences had been allocated (e.g. Finland, UK), and the licensing process was underway or planned in others (e.g. Germany, France, Spain). The main motivation was to prepare Europe's mobile system for the Internet age.

Erkki Liikanen, European Commissioner responsible for Enterprise and the Information Society : "Europe is moving towards the knowledge-based economy. And Europe will have a strong position in some key areas. One of them will be the mobile Internet. Europe is the undisputed world leader in mobile communications ...There are already some 140 million mobile users in Europe — that's over one-third of the EU population...New innovative services are rapidly gaining momentum, in particular WAP services and m-commerce. And this gives us only a foretaste of what third-generation — or 3G -mobile systems — have in store for us : the mobile broadband Internet", in "Is there a third way for the Internet in Europe?", speech delivered at Global Internet Summit, Barcelona, 22 May 2000. Available at <<http://www.europa.eu.int>>.

⁴⁴ Erkki Liikanen, Barcelona, 22 May 2000, *ibid*.

affordable high-speed services based on DSL technologies"⁴⁵ (emphasis added).

Given the short-term requirement to speed up large-scale deployment of Internet access at affordable rates in Europe, and to open up development towards high-speed multimedia Internet applications, the Commission chose a two-pronged approach :

- immediate action with regard to unbundling the local loop⁴⁶, developing further the combined use of "soft law" under sector regulation and of antitrust, which had already been successful in tackling interconnection rates in Europe.
- commitment to broad reform, in the context of the 1999 review⁴⁷, of the access framework, and the close integration of sector regulation and antitrust principles, particularly of the market definitions used under both frameworks.

(cont'd)

It should be noted that access to (unbundling of) the local loop of the Bell Operating Companies and their successors (subsequent to the merger wave following the Telecommunications Act of 1996) has been a prevailing issue in the US. For a recent analysis of the complex trade-offs between the common carrier tradition in US telecommunications regulation and the maintenance of investment incentives for both telephone and cable companies see John C.B. LeGates, "Open Access in the Local Telephone Loop : A Grand Tour of the Entangled Issues", Program on Information Resources Policy, Center for Information Policy Research, Harvard University (April 2000, Incidental Paper). Available at <<http://www.pirp.harvard.edu>>.

Note also the continuing debate in Japan on the access conditions to NTT's local network.

⁴⁵ Erkki Liikanen, *ibid.* DSL (Digital Subscriber Loop) is a family of technologies allowing to upgrade the normal telephone wire to high speed access.

⁴⁶ See Commission press release, "Commission acts to liberalise the 'last mile'. Local loop unbundling will boost high-speed Internet access" (IP/00/408), 26.4.2000 . "Commissioners Liikanen and Monti declared that 'the local access network' remains one of the least competitive segments of the liberalised telecommunications sector . The measures addressed by the Commission to Member States on unbundled access to the local loop will help stimulate competition in the local access network, giving businesses and consumers access to an affordable advanced communications infrastructure and a wide range of services".

⁴⁷ See "Towards a new Framework for Electronic Communications Infrastructure and associated services", COM(1999)539, *supra*, and "Results of the public consultation" , COM(2000)239, *supra*.

With regard to the first, the Commission issued a Recommendation⁴⁸ (i.e. soft legislation) and a communication⁴⁹ updating its approach to obligations under EU antitrust law for providing access to unbundled network elements.⁵⁰ The intention was to establish a fast-track procedure towards unbundling, by using a soft law approach under the form of a recommendation directed at the NRAs (the national regulators) and the incumbent telecommunications operators, but at the same time making it clear that the Recommendation would be used as a measure in proceedings under Articles 81/82 TEC establishing abusive behaviour, or, more particularly, refusal of access to an essential facility⁵¹.

The Recommendation recommended implementation of full unbundling for 31 December 2000 at the latest. The Communication, building on the *Access Notice* discussed previously⁵² went to some detail on certain aspects, in order to integrate conclusions from the "*Bronner Judgment*",⁵³ in which the European Court of Justice had made it clear that it would favour a narrow interpretation of the essential facilities doctrine in Europe, in order to safeguard investment incentives.

(cont'd)

⁴⁸ *Commission Recommendation on Unbundled Access to the Local Loop*, C(2000)1059, 26 April 2000. Available at <http://www.europa.eu.int/comm/information_society/policy/telecom/index_en.htm>.

⁴⁹ Communication from the Commission: "Unbundled Access to the Local Loop", COM(2000)237, 26 April 2000. Available at <http://www.europa.eu.int/comm/information_society/policy/telecom/index_en.htm>.

⁵⁰ Permitting "unbundled access to the local loop" is defined as "allowing other operators to use, partially or fully, the local loops installed by incumbent telephone operators, enabling them to install new cost-effective technologies such as DSL (Digital Subscriber Loop). Under full unbundled access to the local loop new entrants would have full control of the commercial relationship with their customers, and in this way, new market entrants would be able to deploy all type of new technologies and to provide competitive services to consumers, including new broadband services." "This will facilitate the deployment of high speed Internet services." See IP/00/408, *supra*.

For a recent discussion of options for the "bottom-up" development of the local loop particularly in the local and municipal area see Deborah Hurley and James H. Keller (eds.), *The First 100 Feet, Options for Internet and Broadband Access* (The MIT Press Books, 1999). See <<http://www.ksg.harvard.edu/iip/>>.

⁵¹ It should be noted that a number of Member States have already undertaken, or announced, unbundling of the local loop.

⁵² See Chapter II.

⁵³ Case C-7/97, *supra*. The case concerned access to home delivery services for print media by a competitor.

The Communication argued⁵⁴ that the "incumbents' local network are the only networks which have been developed nation-wide in each of the Member States".⁵⁵ The Communication described in some detail why the case of unbundling satisfied the *Bronner* test , in particular⁵⁶ :

- "Given the size of the investment required, the absolute cost of nation-wide duplication of the incumbents' network with a similar population coverage is likely to be a barrier to entry for any competitor. This infrastructure appears to be with present technologies economically unfeasible⁵⁷, or unreasonably difficult to duplicate at a nation-wide level, in a reasonable time period".
- "A refusal from an incumbent to give access to competitors on its local loop is thus likely to eliminate the possibility for new entrants to compete at all on the nation-wide market⁵⁸".

The Communication re-emphasised a number of principles resulting from EU competition rules (set out in the *Access Notice*) with regard to the conditions of access , in particular those concerning delays, discrimination, and price abuses.

Without going into further detail, it was made clear that with the introduction of soft legislation on a key issue for access to the future Internet infrastructure in the EU, the Commission favoured a shift away

⁵⁴ The Commission also found that the telephone networks of the incumbents "still deliver the bulk of access services to end-users — the connection and the line rental — and held a share of the local call market which, except in the UK, is well above 90% and in most cases close to 100%".

⁵⁵ Communication supra, chapter 3.2

⁵⁶ Ibid. , chapter 3.2

⁵⁷ Cf *Bronner*, par 44

⁵⁸ Ibid., par 38

from traditional telecom regulation towards a more flexible scheme⁵⁹, while , with the emphasis on antitrust action to offer remedy in case of non-compliance, it initiated a gradual shift towards basing the future regulation of the sector on EU competition law principles.

This became even clearer in the announced shift of emphasis for the general reform⁶⁰, as put forward in

⁵⁹ Though the Commission did not exclude at the time that a firm regulatory obligation would be introduced subsequently in the final regulatory package.

Indeed, the package of legislative proposals, as announced on 12 July 2000 (supra), included the proposal of a (directly applicable and binding) Regulation to enforce unbundling in all EU Member States by 31 December 2000. The statement published referred to the soft law approach announced in April but stated that "since then [...] it has become increasingly apparent that , despite progress made in some Member States, non-binding measures are unlikely to achieve local loop unbundling on a sufficiently harmonised basis across the EU by 31 December 2000". The Regulation is based on Article 95, TEC, and requires approval by the European Parliament and Council to enter into force. See press release "Commission proposes unbundling local loop by end of year" (IP/00/750), 12.7.2000. Available at <<http://www.europa.eu.int>>.

With this proposal, it became clear that inspite of the preference for a more flexible approach the Commission would not hesitate to back up "soft legislation" with "hard" law measures in case of need, especially during the critical current transition towards full effective competition in all segments of the EU's telecommunications market.

⁶⁰ At Global Internet Summit, 24 May, supra, Commissioner Liikanen defined the goals of the review and the outcome as follows : "First, simplify and clarify the existing framework — bringing the number of regulatory measures down to 6 from currently 20 ; second, introduce greater flexibility in the framework — by relying more heavily on accompanying non-binding measures ; third, adapt the 1998 telecoms framework in the light of technology and market development ; four, introduce greater competition, in particular in the local loop. As competition grows further, it will be possible to rely increasingly on competition rules."

The package of legislative proposals finally announced on 12 July 2000 followed these lines. The package aims at consolidating the existing EU telecommunications legislation into a more limited number of directives. The press release published on that occasion stated that the new regulatory framework would "significantly simplify and clarify the existing regulatory framework ...". The proposed consolidated framework comprises :

- "Five harmonisation Directives, including a Framework Directive and four specific Directives on authorisation, access and interconnection, universal service and user rights, and data protection in telecommunications services [essentially consolidating the current ONP directives (see Chapter II), and certain measures applying to television standards and protection of privacy in telecommunications].
- A Regulation on the unbundling of the local loop [supra].
- A draft Commission Liberalisation Directive [consolidating the existing Article 86 Directives issued under EC Competition Law (see Chapter II)].
- A Decision on Community radio spectrum policy.

See COM(2000)393 (Framework), COM(2000)386 (authorisation), COM(2000)384 (access and interconnection), COM(2000)392 (universal service and user rights), COM(2000)385 (data protection and privacy), COM(2000)394 (unbundling), COM(2000)407 (radio spectrum), available at <http://europa.eu.int/comm/information_society/policy/framework/index_en.htm> and *Draft Competition Directive consolidating existing Directives on Competition in the Telecommunications Markets*, 12.7.2000, available at <<http://www.europa.eu.int/comm/competition/whatsnew.html>>.

the general Communication on the consultation on the 1999 review.⁶¹

The central shift of emphasis concerns access and interconnection obligations. The Commission proposed to change the cornerstone of the current framework by modifying "the concept of significant market power and [using] it as the underlying concept for imposing ex-ante obligations relating to access and interconnection. In particular the market share threshold of 25% would no longer be part of the definition. Instead, the definition would be based on the concept of dominant position in particular markets, calculated in a manner consistent with EC competition law practice, as a trigger for the heavier ex-ante obligations, and would cover all aspects including joint dominance and leverage of market power into associated markets"(emphasis added)⁶²

In practice this would mean that in the future, the basis of sector-specific regulatory intervention would be application of antitrust theory, at least as far as market definitions and the determination of market power are concerned. The approach would eliminate a major potential source of conflict between the current approach under EU-sector regulation and the antitrust approach concerning access to the

(cont'd)

See press release "Commission proposes overhaul of rules for electronic communications" (IP/00/749), supra. Commissioner Erkki Liikanen confirmed on the occasion the previously set goals. He stated : "Less regulation, easier market entry and a level playing field across [the] EU are prerequisites for development of world class telecommunications and Internet services in Europe ...".

⁶¹ Communication on the results of the public consultation COM(2000)239, 26 April 2000, supra.

⁶² Ibid., chapter 3.3.

The proposed legislative package (supra) confirmed this approach. It said that "the definition of significant market power [...] now needs to be adapted to suit more complex and dynamic markets, and for this reason is being modified to be based on the concept of dominance as defined in the case law of the Court of Justice and the Court of First Instance of the European Communities". See "Proposal for a Directive of the European Parliament and of the Council on a common regulatory framework for electronic communications networks and services", COM(2000)393, 12 July 2000, point 20. Available at <http://europa.eu.int/comm/information_society/policy/framework/index_en.htm>.

Articles 13 and 14 of that proposed Directive (the new Framework Directive) set out principles and market analysis procedure to further detail.

communications infrastructure⁶³. At the same time, this more flexible approach, based on analysis of actual market power, would seem to open the way towards a potentially more generalised application of access obligations, and their application also to higher levels of access, beyond the basic telecommunications infrastructure. The growing convergence of the communications markets and the resulting requirement for a more flexible framework have made this rebalancing towards (the more generalised) antitrust principles inevitable.

Given the close relationship between the EU's ONP (sector regulation) framework and its obligations under the WTO telecommunications "Regulatory Annex"⁶⁴, it will be interesting to see how the concept of "major supplier" in that Annex will be interpreted in the future.

The "major supplier" concept is the basic concept concerning access and interconnection obligations entered by all parties which have committed to the "Regulatory Annex" under the WTO basic telecom agreement.⁶⁵ The Annex states in particular⁶⁶ : "*Interconnection to be ensured*: Within the limits of permitted market access, interconnection with a major supplier will be ensured at any technically feasible point in the network....". The commitments have been in particular entered into by the US, Japan and the EU. Common efforts will be required to ensure common interpretation, as access concepts evolve.

⁶³ It will be interesting to see how a number of consequences of this major change will be tackled. In practice, arrangements will have to be worked out at the enforcement level between sector-specific entities and antitrust authorities — both at the EU and the national level, particularly concerning market definitions and determination of dominant positions

⁶⁴ WTO Basic Telecoms Agreement. "Additional Commitments" taken in the schedules committed to by a number of countries, inter alia the US, Japan, and the EU, also known as the "Reference Paper", *supra*.

⁶⁵ WTO : EU Additional Commitments , *supra*, point 2.

⁶⁶ *Ibid*, point 2.2

IV) GOING GLOBAL : ACCESS TO TOP-LEVEL CONNECTIVITY IN GLOBAL MARKETS

While securing access to the basic telecom infrastructure is the very basis for ensuring access to a global network, though it falls under national regulatory approaches⁶⁷, access to "top-level connectivity" has turned out to be a phenomenon that can only be analysed in a global context and with a global market definition.

In the EU, access to "top-level Internet connectivity" was investigated for the first time to substantial detail in the *Worldcom-MCI* case.⁶⁸

The investigation was carried out under the EU merger regulation⁶⁹. It focussed on concerns "about the parties' combined market share in relation to the supply of Internet backbone services"⁷⁰.

⁶⁷ Though national regulatory approaches are correlated to a substantial extent via the obligations to ensure access taken under the WTO Basic Telecommunications Agreement, *supra*.

⁶⁸ The case concerned a merger between WorldCom, Inc and MCI Communications Corporation (MCI). The two companies were described as "US-based international telecommunications companies offering a range of services including telecommunications services and Internet services" (IP/98/213), *infra*.

Available at <<http://www.europa.eu.int/comm/dg04/lawmerg/merger.htm>>.

⁷⁰ Press release, *supra*. The Commission found significant overlaps in this market .

In the course of the investigation the Commission identified for the first time the hierarchical market power structure and the effect of network externalities in the Internet to substantial detail — a finding quite contrary to the beliefs that the Internet is by nature a highly distributed structure.⁷¹

As described in the *Decision*, as the NSF⁷² withdrew in the mid-nineties from financing the Internet backbone, private companies took over the role of supplying the underlying long-distance lines that link the different networks in the "inter-net". Some of the initial regional networks began to operate as "Internet Service Providers" (ISPs), offering access services on a commercial basis to paying subscribers. "From the time of withdrawal of the NSF, the Internet could no longer be regarded as a hierarchy of networks joined by a single unifying backbone, but as a number of networks connected to different backbones requiring mutual interconnection if the dependent networks (or ISPs) were to be able to continue sending traffic to each other".⁷³

As a consequence, the commercial operators of the network split into two groups : a highly concentrated leading group of backbone providers which "peer" (interconnect on a traffic exchange basis⁷⁴), and those who pay access charges⁷⁵ to this "top-level" group of companies who "can provide connectivity anywhere on the Internet solely through their own peering agreements with other network ..."⁷⁶

⁷¹ In fact, during the investigation the parties argued that the "Internet was originally conceived to be non-hierarchical in form, in order to avoid the strategic vulnerabilities associated with network architectures based on centralised and hierarchical switching and tiered structures." *Decision*, point 50. It should be recalled that the original Internet developed out of the Arpanet during the sixties, sponsored under US Defence programs.

⁷² National Science Foundation. See "Brief History of the Internet", Chapter I.

⁷³ *Decision* point 23, *supra*

⁷⁴ I.e. settlement- or payment-free.

⁷⁵ Called "transit" arrangements and transit charges.

⁷⁶ I.e. agreements with other network operators for mutual termination of traffic.

without having to rely on the purchase of a 'transit' service from any provider".⁷⁷ The investigation established that the difficulty for the smaller networks in obtaining peering with the top-level networks meant that "the number of ISPs who enjoy the status of top-level networks is kept relatively small".⁷⁸

The investigation defined the relevant market as the market for the provision of "top-level " or "universal" Internet connectivity. This market was found to be effectively a global market.

The major issue that emerged during this investigation was the finding that the Internet was controlled by a highly concentrated group of providers dominating that market,⁷⁹ quite independent from the geographical location of their physical backbones.

The Commission also found that the parties would through their merger hold over 50% of that market on the basis of the chosen methodology for market sizing and for share based on revenue and traffic flow.⁸⁰ It concluded that the merged entity⁸¹ "would control market entry by denial of new peering requests, foreclosure or the threat of foreclosure of peering agreements and/or their replacement with paid interconnection"⁸².

Without going into further details of the case⁸³, three points should be made :

⁷⁷ IP/98/639, supra. See also explanation of top-level networks in *Decision*, point 41, supra.

⁷⁸ *Decision*, point 45, supra

⁷⁹ By the time of the investigation the following "big four" were named to having a position stronger than all others in this market : WorldCom, MCI, Sprint and GTE/BBN. See *Decision*, point 102.

⁸⁰ *Decision* , point 114

⁸¹ I.e. MCI/WorldCom

⁸² *Decision*, point 119

⁸³ The investigation concluded that in the absence of competitive constraints and effective potential competition the merger would "if not altered, lead to the creation of a dominant position in the market for the provision of top-level

- the definition of a global market for Internet connectivity and the critical role of access to that connectivity⁸⁴ was recognised for the first time as a central concept.
- the investigation pinpointed one of the core changes in the Internet economy, which has been dubbed "winner take most"⁸⁵: "The merger might well create a 'snowball effect', in that MCI Worldcom would be better placed than any of its competitors to capture future growth through new customers, because of the attractions for any new customer of direct connection with the largest network, and the relative unattractiveness of competitors' offerings owing to the threat of disconnection or degradation of peering which MCI/Worldcom's competitors must constantly live under"⁸⁶ (emphasis added). It has been suggested that in the world of the New Economy, "the avalanche, rather than the thermostat becomes the more attractive metaphor for economic

(cont'd)

or universal Internet connectivity", *Decision*, point 135.

The merger was cleared on the basis of structural remedies offered by the parties, i.e. "their commitment to divesting MCI's Internet assets, thus eliminating the overlap with WorldCom's Internet business", Press release IP/ 98/639, *supra*.

⁸⁴ The central role of top-level connectivity as a future concept was re-confirmed on the occasion of the subsequent notification and investigation of the planned MCI WorldCom / Sprint merger. "The Commission has raised serious doubts as to the compatibility of the proposed merger between MCI WorldCom and Sprint mainly because of its impact on competition in the market for top-level Internet connectivity". See Commission press release, "Commission opens full investigation into the MCI WorldCom / Sprint merger" (IP/00/174), 21.2.2000. Available at <<http://www.europe.eu.int>>.

On 28 June 2000, the Commission prohibited the merger "as it would have resulted in the creation of a dominant position in the market for top-level universal Internet connectivity." "An in-depth investigation by the Commission showed that the merger would, through the combination of the merging parties' extensive networks and large customer base, have led to the creation of such a powerful force that both competitors and customers would have been dependent on the new company to obtain universal Internet connectivity." The investigation was carried out in close cooperation with the US Department of Justice. See "Commission prohibits merger between MCI WorldCom and Sprint" (IP/00/668), 28.6.2000. Available at <<http://www.europe.eu.int>>.

⁸⁵ Ken Fox, quoted in *Wall Street Journal*, 9 June 2000, *supra*.

⁸⁶ *Decision*, point 131

policy".⁸⁷

- investigation and enforcement in the global Internet market requires cooperation on antitrust policy closer than ever before. In the *WorldCom/MCI* case there was an exchange of letters⁸⁸, "whereby the Commission requested the DoJ's cooperation regarding the undertakings which were mutually offered to both the Commission and the DoJ. The DoJ confirmed that it will take whatever steps are necessary and appropriate to evaluate, and if it finds them to be sufficient, to seek the effective implementation of these undertakings"⁸⁹.

A similar announcement of close cooperation was made for the subsequent MCI-WorldCom/Sprint case⁹⁰.

Given the strong network externalities of the New Economy, access to global connectivity is bound to become a major and permanent issue in international antitrust. Many layers of the Internet are potential bottleneck candidates. A well-known example is access to the Internet address space, the logical core of the Internet and the root servers⁹¹. Other effects of high concentration of market power at the "top-

⁸⁷ Treasury Secretary Lawrence H. Summers in "The New Wealth of Nations", 10 May 2000, *supra*.

⁸⁸ Between the Director-General of the Directorate-General for Competition and the Assistant Attorney General in charge of the Antitrust Division, United States Department of Justice (DoJ), in accordance with Article IV of the Agreement between the European Communities and the Government of the United States of America regarding the application of their competition laws. See Agreement, OJ L 95, 27.4.1995, p.47. Available at <<http://www.europa.eu.int/eur-lex/en/index.html>>.

⁸⁹ *Decision*, point 164

⁹⁰ See press release IP/00/174, *supra*.

⁹¹ The root servers are the basis for routing calls (packets) via the Internet. Originally, the top root servers were operated under a contract between the US Department of Commerce and academic and private institutions, in particular Network Solutions Inc., a private company.

Subsequent to the publication of a White Paper, a non-profit organisation was set up under Californian law, under an agreement with the US Department of Commerce (ICANN — Internet Corporation for Assigned Numbers and Names). It started to introduce competition into the allocation of "top domain names" (the dot.com, dot.gov,

level" may be seen at the level of the so-called certification and trust services⁹², the billing and payment systems currently being built up to underpin worldwide transactions for e-commerce via the Internet both by existing credit card companies and others, and of course in the well-known case of browser access software. Even in the e-commerce field — on top of the Internet proper — which is generally seen as an area of low entry costs and therefore highly competitive, strong externality effects may start to work, and global access issues may arise. On-line auction markets may become an example,⁹³ while Business-to-Business (B2B) exchanges grouping major companies at a global level for negotiating supply and demand may become another case in point.

Given the global and pervasive nature of the Internet, which in many cases will void national market definitions of real meaning, coordination in investigation and enforcement of antitrust will be vital. Developing common principles in international antitrust in dealing with the New Economy effects will have to become a first-priority issue. The issue is complicated by the fact that in a number of cases the

(cont'd)

dot.org, dot.net, dot.edu, dot.int, etc) and of Internet address blocks. In spring 2000, the top root server, the physical basis for implementing the address space, and related data bases (e.g. the WHOIS data base) were still operated by Network Solutions Inc. (NSI) which was taken over in a major deal by Verisign Inc, a major actor in Internet trust and certification services. See United States Department of Commerce, "Management of Internet Names and Addresses, Docket Number : 980212036-8146-02, 6.5.1998 DNS Statement of Policy. Available at <<http://www.ntia.doc.gov/nttiahome/domainname>>. For an account of the development of the management of Internet Domain Names and related issues see Milton Mueller, "Technology and Institutional Innovation : Internet Domain Names", *International Journal of Communications Law and Policy* (Issue 5, Summer 2000). Available at <<http://www.ijclp.org>>.

For an EU position on ICANN related issues see Communication from the Commission to the Council and the European Parliament, "The Organisation and Management of the Internet / International and European Policy Issues 1998 - 2000 COM(2000)202. Available at <http://www.europa.eu.int/comm/information_society/policy/telecom/index_en.htm>.

⁹² Certification and trust services guarantee the security of transactions via the Internet.

⁹³ Alan Murray in *Wall Street Journal*, 9 June 2000, supra : "EBay Inc. dominates the online-auction market because it is the biggest. Sellers go there to reach the most buyers ; buyers go there to reach the most sellers".

development of innovative markets passes through a temporary strong market position or monopoly by lead actors⁹⁴. In many cases antitrust regulators will search for an optimal mix of structural and behavioural remedies, in order to guarantee the development of competitive market structures on the one hand, and the fair remuneration of the innovator's high-risk investment (the motor of the New Economy) on the other.⁹⁵ Antitrust decisions of the future will have more and more global implications and will raise increasingly complex global enforcement issues. Securing access to all levels of the new networked economy for market actors will be in the focus of international antitrust development.

(cont'd)

⁹⁴ A well-known problem in the Intellectual Property Rights field.

⁹⁵ Recent regulatory and antitrust decisions tend to be a mix of structural and behavioural measures. In the case of the *Vodafone Airtouch/Mannesmann* merger in the mobile communications sector, the largest merger ever, the European Commission requested divestiture of mobile networks in two national markets to eliminate overlap ; it accepted undertakings by Vodafone Airtouch aiming at enabling third party non-discriminatory access to the merged entities integrated network, so as to respond to the Commission's serious concerns about access for competitors to the market for competitive seamless pan-European mobile services. Undertakings were limited to three years, given the roll out of third generation mobile (3G) networks and the expected growth of real alternatives to Vodafone/Airtouch's network footprint. See press release "Commission clears merger between Vodafone Airtouch and Mannesmann AG with conditions" (IP/00/373), 12.4.2000. Available at <<http://www.europa.eu.int>>. Decision : Case No COMP/M.1795 - *Vodafone Airtouch/Mannesmann*, 12.4.2000. See point 58. Available at <http://www.europa.eu.int/comm/dg04/index_en.htm>.

A similar line was taken in major cases on local access concerning cable networks. In the Decision on the *Telia / Telenor* merger concerning the telecom incumbents in Sweden respectively Norway — later abandoned by the parties — the Commission accepted a number of divestiture commitments, in particular of the cable TV networks in Sweden and Norway, and requested, in addition, access commitments (local loop unbundling) in both countries. On the occasion it stated that "the Commission will have a very close look at access to local telecommunications and cable TV networks when assessing any future notifications of mergers or joint ventures between those incumbent operators. It may be the case that the Commission will again require cable TV network divestitures and/or local loop unbundling in future cases in order to resolve competition issues." It continued, "this policy is consistent with the line taken in the Cable Review in 1998, where legal separation as the minimum was required between cable TV networks and Telecommunications networks owned by the same incumbent operator". See Chapter III and Commission press release IP/99/413 , 13.10.1999 .

See also recent FCC (Federal Communications Commission) decision on the *AT&T/MediaOne* merger, where the FCC insisted on divestitures in order to decrease the effect of the merger on the cable TV market, and noted that it expected "AT&T to fulfil its voluntary commitments to give unaffiliated Internet service providers (ISPs) access to its cable systems to provide broadband services to consumers". It also noted "that AT&T has entered a proposed consent decree with the U.S.Department of Justice, which requires the merged firm to divest its interest in the cable broadband ISP Road Runner and to obtain Justice Department approval prior to entering certain types of broadband arrangements with Time Warner and America Online".

V) CONCLUSIONS

Access issues in the New Economy are bound to grow in importance. Services often involve very large upfront investments, be it in networks, organisation, or brand building, but often involve low distribution costs. According to commentators,⁹⁶ "in such business it is inexpensive to expand rapidly into a dominant position, and dangerous [from the company's perspective] not to".

Quite contrary to many of the beliefs of Internet libertarians who count on low costs of entry and a robust competitive environment, many segments of the new Internet-based economy — driven by the any-to-any principle, and the requirement in many instances to show worldwide presence to reach scale economies — could develop towards structures controlled by highly dominant enterprises. While the current concentration of much of the Internet economy in the US⁹⁷ still may allow tackling certain of these effects in a national framework, as does the localised nature of the local access layer of the Internet, the implications of measures taken will in many cases be global.

This paper has limited itself to discussing briefly two layers directly related to the Internet : the issue of local telecom access, and the issue of access to global Internet connectivity. In the first instance, as developments in the European Union show, convergence and the emergence of the new Internet markets will make antitrust considerations increasingly important. Approaches taken on local access are now linked into a multilateral framework, given the obligations the US, Japan, the European Union and

⁹⁶ Alan Murray in *Wall Street Journal*, 9 June 2000, *supra*.

⁹⁷ "The Internet traffic currently originates disproportionately from the United States, where the large majority of web sites are based. Most web pages are in English and most of them are hosted in the United States. Of the 100 most visited web sites, 94 are located physically in the United States", (emphasis added). See Commission press release "Commission proposes programme to stimulate presence of European digital content on the Internet" (IP/00/513), 24.5.2000. Available at <<http://www.europa.eu.int>>.

others have taken under the WTO Basic Telecommunications Agreement⁹⁸.

In the second instance, bilateral antitrust cooperation, such as that within the US/EU agreement, was the only way to come to common positions in tackling the antitrust issues involved.⁹⁹ In all cases, at this stage of development of the world market, the members of the triad US/Japan/EU will be primarily called upon to act because together they currently account for 75% of the world's Internet access.

This paper has not addressed other main issues involved in Internet access where "top-level"¹⁰⁰ effects could develop. One set of issues are the platforms formed in business-to-business (B2B) e-commerce between major suppliers or buyers with a global impact. Others concern access to content. One of the main issues in the major current antitrust case in the US concerns control of the access software to the World Wide Web. In all of these areas more international cooperation and coordination will be needed to define common principles in market definitions and remedies, as well as in enforcement. In many cases, the implications of decisions will be global.

As stated by European Commission President Prodi, the Commission follows "a focused strategy to address the key barriers to the further uptake of the Internet in Europe and ensure that the framework conditions are established for a decisive move towards the new knowledge-based economy"¹⁰¹. A global Internet economy will need a global view of antitrust and its enforcement mechanisms. Suffice it to say in conclusion that the Internet and the New Economy have the promise of more competition and more consumer benefit. But as with any promise, it must still be realised. Global cooperation on antitrust will

⁹⁸ See Chapter III.

be a major element in that realisation.
