13 April 2015

Market design

- Establishes rules of market interaction
- Economic engineering
 - Economics
 - Computer science
 - Engineering, operations research

Market design accomplishments

- Improve allocations
- Improve price information
- Reduce risk
- Enhance competition
- Mitigate market failures

Applications

- Electricity markets
- Spectrum auctions
- Natural resource auctions (timber, oil, etc.)
- Emission allowance auctions
- Financial securities
- Procurement

Objectives

- Efficiency
- Transparency
- Fairness
- Simplicity

Principle

"Make things as simple as possible, but not simpler" -- Albert Einstein

Electricity

Goals of electricity markets

- Short-run efficiency
 - Least-cost operation of existing resources
- Long-run efficiency
 - Right quantity and mix of resources

Challenges of electricity markets

- Must balance supply and demand at every instant at every location
- Physical constraints of network
- Absence of demand response
- Climate policy

Climate policy

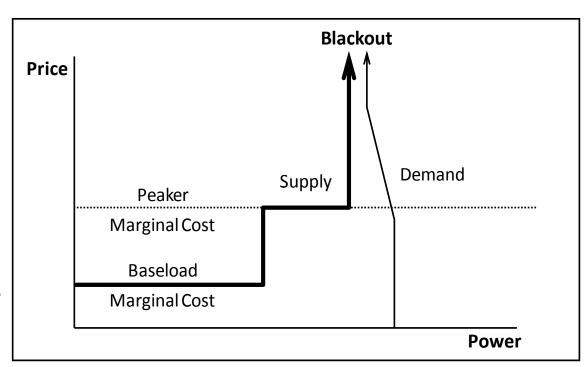

- Transformation to renewable
- Germany
 - Replace nuclear with renewable
 - 80% renewable (mostly wind) by 2050
 - Significant probability of multiple days with wind in-feed less than 5% of capacity
 - Must back-up wind with peaker capacity
 - Require additional 30 GW of peakers by 2030
 - How to get this built?

Three Markets

- Short term (5 to 60 minutes)
 - Spot energy market
 - Energy: day ahead, real time with congestion pricing
 - Reserves: 30m non-spin, 10m non-spin, 10m spin, freq. regulation
- Medium term (1 month to 3 years)
 - Forward energy market
 - Bilateral contracts
- Long term (4 to 20 years)
 - Capacity market (thermal system)
 - Firm energy market (hydro system)
 - Bilateral contracts (Texas, Nord Pool)
- Address risk, market power, and investment

Why not energy only?

- Market failure
 - Absence of demand side
- Practical realities
 - Price caps
 - Operator decisions
 - Missing money

Long-term market: Buy enough in advance

Purpose of market

- Operational reliability
- Pay no more than necessary
 - Induce just enough investment to maintain adequate resources
 - Induce efficient mix of resources
 - Reduce market risk
 - Reduce market power during scarcity

Product

- What is load buying?
 - Energy during scarcity period (capacity)
- Enhance substitution
 - Technology neutral where possible
 - Separate zones only as needed in response to binding constraints
- Long-term commitment for new resources to reduce risk

Pay for Performance

- Strong performance incentives
 - Obligation to supply during scarcity events
 - Deviations settled at price > \$5000/MWh
 - Penalties for underperformance
 - Rewards for overperformance
- Tend to be too weak in practice, leading to
 - Contract defaults
 - Unreliable resources
- Recent adopters: ISO New England, PJM (and Texas within energy-only market)

State aid issues

Pricing rule

- Single-price (pay-as-clear) vs. pay-as-bid
- Is paying the clearing price to low-cost units state aid?
 - Of course not!

New vs. existing

- New investment desires long-term commitment (5 to 20 years)
- Existing does not need long-term commitment (1 year is best)
- Can we have the same price?
 - Yes, existing gets same price in expectation
- But does existing need to be paid at all
 - Yes, if solution is consistent with long run market

Conclusion

- Never ignore essentials
 - Encourage participation
 - Demand performance
 - Make bids binding (deposits or letters of credit)
 - Avoid collusion and corruption
- Long-run market requires
 - Well-functioning spot market
 - Strong regulatory framework with manageable regulatory risk
